

# AGISTIX SOLUTION

## Centralized platform for processing and managing global shipments

The Agistix web-based platform offers businesses a centralized system for managing inbound, outbound, and direct shipments, international and domestic, across any mode of transportation regardless of carrier. Organizations easily customize user roles and permissions and configure the automated routing guide enabling control of shipping costs at the point of execution. A simple web interface to administer user, carrier, and supplier mappings as well as manage the routing guide eliminates the need for IT resources and applies changes across the entire supply chain instantaneously.

Customers that utilize Agistix have instant access to detailed shipment information to support a variety of organizational needs from inbound shipment management to forecasting estimated shipping costs. In addition to typical shipment information, users easily access package details such as SKUs, HTS, and ECCN classifications, who processed the shipment, multiple reference numbers, detailed hazmat specifications and crating details. Users execute shipments based on real-time carrier rates, customized routing guide rules, or previously negotiated carrier agreements. After booking a shipment, users receive instant visibility to tracking information through carrier integrations that are updated on an ongoing basis. Customized reports can be created to assist in areas such as carrier performance, supplier fulfillment, inbound shipment estimated arrival dates, and accrued shipping costs.

## Easy integration, supply chain flexibility

Agistix can easily integrate with existing ERP systems via web services, custom XML, EDI, or batch uploads offering one source to access all carrier systems for rating, booking, and tracking. The Agistix platform can also supplement ERP's to support non-inventory shipments without creating erroneous items in the master system of record. Implementing the Agistix solution allows customers to not only improve efficiencies and reduce costs, but also gain true supply chain flexibility without disrupting operational processes or dependency on IT resources.

## BENEFITS

### Instant Visibility

- Global traffic managers have access to all supply chain shipping activity in one interface
- Receiving locations have complete visibility to all in-transit shipments, regardless of supplier, carrier, or mode
- Procurement can more accurately manage supply chain fulfillment

### Improve Cost Management

- Reduce costs resulting from use of unapproved carriers and service levels
- Mitigate unauthorized transportation costs which results in savings of up to 20 % of a company's annual freight spend
- Leverage the global spot-market to instantly identify excess carrier capacity and low rates

### Increase Routing Guide Compliance

- Enforce carrier and service level selection across all shipping locations
- Custom routing guide creation based on any combination of shipment attributes
- Manage and deploy routing guide changes across entire supply chain in real-time

### Real-Time Reporting

- Create custom reports to proactively manage all supply chain activity
- Schedule and automate recurring reports in any format and any frequency
- Facilitate inter-department collaboration with permission-based access to standardized shipment data
